DETAILED ACTION

1. Claims 1-25 are pending in this application.

Allowable Subject matter

2. Claims 1-25 are allowed.

The examiner deems claims 1-25, as novel when viewed as a whole for the limitations of iterative search with data accumulation in cognitive control framework.

The closest prior art of record, Steinberg discloses searching hypotheses for locations of objects in a playback image corresponding to a recorded image generated by a graphical user interface (GUI) of an application program comprising: capturing the playback image (Steinberg: [0149], acquisition of playback image); detecting at least one active object in the recorded image (Steinberg: detection of image); searching subsets of hypotheses from the playback image for an object according to predetermined criteria (Steinburg: [0165], using predetermined criteria; [0193], using predefined criteria); recalculating old actions for the object in the playback image by applying actions according to an execution scenario and loading a next set of data, when the object is found (Steinberg: iteratively calculating image parameters); and

Art Unit: 2164

although, Steinberg discloses calculating relative size and location of image objects (Steinberg: [0165]), Steinberg, however, does not explicitly disclose checking of dynamic conditions. Kuth, however, discloses checking of dynamic conditions or parameters (Kuth: [0027], parameters for the dynamic variation of the image data).

However, the prior art of record fails to anticipate or render obvious the recited feature of the limitations cited above added with capturing the a selected playback image, the playback image being one of a series of display images generated over time by a graphical user interface (GUI) of an application program being tested by a cognitive control framework (CCF) system in a playback phase in response to simulated user inputs to the application program; detecting at least one active display object in a recorded image, the recorded image being one of a series of display images generated over time by the GUI of the application program being tested and captured during a recording phase of the CCF system based on user inputs to the application program, the user inputs, time interval between user inputs, and resulting display data forming an execution scenario script for use in testing the GUI of the application program during the playback phase for generating playback images, the at least one active display object being a portion of the recorded image being acted upon as a result of user input; searching subsets of hypotheses of locations of display objects in the captured playback image for a matching display object corresponding to the detected at least one active display object of the recorded image according to predetermined criteria; recalculating old actions for the matching display object in the playback image by applying actions

Art Unit: 2164

according to the execution scenario script and loading a next set of data, when the corresponding matching display object is found; and checking dynamic conditions, including the time between user inputs.

These features, together with the other limitations of the independent claims are novel and non-obvious over the prior art of record. The dependent claims being definite, enabled by the specification, and further limiting to the independent claims, are also allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance".
